1948 INTRODUCTIONS

SMALL VARIETIES

ORDER EARLY

Early orders will help us in booking your order and reserving the stock for you and thus schedule it for the proper shipping time. Do not send us an order at the height of our shipping season and expect delivery in 3 to 5 days. The orders booked weeks and months ahead that are scheduled for specific shipping dates will go out first and the last minute orders will follow as soon as we can get them off.

On late orders, kindly give a second choice. Owing to the shortage of stock, on some varieties, kindly indicate on your order whether or not you want us to substitute.

ROOTS

Dahlia roots are divisions of field grown clumps. Each root must contain at least one "eye" from which the plant grows. Sturdy stalks or plants and fine exhibition flowers grow from roots, and strong clumps harvested for the following season. As the planted root acts as a food storehouse for the growing plant, the growth of the plant is thus stabilized under adverse growing conditions.

POT ROOTS

Pot roots are small clumps produced by plants grown mostly in 3" pots in the open during the late Summer, and transferred in the Fall to greenhouses where they are grown under controlled conditions, and allowed to ripen naturally by the end of December. Pot roots should not be judged adversely because of their size, as they will produce bushes and flowers equal to roots, and in many varieties even better clumps on digging. Many experienced growers prefer pot roots.

GREEN PLANTS

Green plants are sprouts or cuttings taken from clumps grown in especially built greenhouses; rooted in sand benches in air-conditioned propagating houses; potted and grown under greenhouse conditions until well established and then moved to cold frames for proper hardening off. When they reach you they are ready for planting.

Our customers have found them highly satisfactory and they are considerably cheaper than roots in the high priced varieties.

Green plants will produce flowers equal to roots or pot roots when well grown for exhibition, but will not produce as large clumps for the following season. When properly grown, however, many varieties will produce nice clumps.

Dahliadel green plants, in our specially designed shipping box, have been successfully sent all over the United States. See "Notice on Green Plant and Rooted Cutting Shipments," page 32.

ROOTED CUTTINGS

Rooted cuttings are sprouts or cuttings grown exactly as described under green plants (see above) up to the point where a good root system has developed. Rooted cuttings are wrapped singly or two together in live sphagnum moss on a special machine built for this work. In shipment the roots are fed moisture in live sphagnum. The leaves are in a ventilated air space. This insures the best and safest transportation. Rooted Dahlia cuttings are 1/3 less in price than plants. However we do not recommend them unless you have had experience and are equipped to handle dahlia cuttings.

UNIFORM COLOR STANDARDS

We should adopt some uniform standard by which color can be accurately measured and uniformly judged and described throughout the country.

With the Horticultural Color Chart now available we have the best answer to this complex problem and with it we should be able to standardize color descriptions of Dahlias, Chrysanthemums, and other plant material. This chart comes to us in a loose sheet folder which is very unhandy to use. We are therefore punching the pages and supplying loose leaf binders.

The American Dahlia Society and the Central States Dahlia Society are working through a joint committee to standardize Type, Size and Color Classification of the Dahlia and unify the Show Schedules as much as possible. The North American Gladiolus Council have already officially adopted this color chart as their standard.

We are working on a pocket edition of the Horticultural Color Chart wherein we will arrange our colors on pages representing each of the principal color classes used in the show room, yellow, orange, autumn, red, etc. On this we will want the approval of both societies before offering it for sale.

INSECT CONTROL

Since the use of DDT much more red spider and mite have been prevalent on dahlias. We have used DDT, nicotine sulphate, rotenone, and pyrethrum in a spray with fair results. Have used DDT with Hexate with fairly good results but we could not recommend either of these sprays to our customers as they gave only a partial control.

A NEW INSECT CONTROL

We have obtained exceptional results, practically 100% insect control with one application of the following spray: 2 heaping tablespoonfuls of 50% wettable BHC in combination with 1/3 teaspoonful TAT Hexate and 1/2 teaspoonful LINCK WA to each gallon of water. Use the same precaution as when spraying with nicotine sulphate. This we feel sure will control the red spider, aphids, mite, and thrips along with practically all the other troublesome insects with the possible exception of the European Corn Borer.

TAT BHC contains the new outstanding chemical Benzene Hexachloride. This product acts as a contact, stomach and fumigant insecticide. It is up to 15 times as toxic to certain insects as DDT yet only 1/5 as toxic to warm blooded animals. Exceptionally effective against sucking bugs, aphids, leaf-eating insects (even killing the egg), wireworms, thrips, scale, grasshoppers, locusts and ants. It does not have the long residual effectiveness of DDT due to its fumigant action, however, this is advantageous in that it reduces the danger of any long lasting residue. 5 lb BHC \$5.00 Postpaid including 4th zone. Add 10c for each additional zone.

Although it has a somewhat objectionable odor, the results are so far ahead of anything else that you gladly tolerate the musty odor.

TAT HEXATE is a newly formulated compound containing Hexaethyl Tetraphosphate and a wetting, spreading agent. Replaces nicotine sulphate in controlling aphids; also excellent for control of plant mites (such as red spider), and other insects.

6 oz. bottle Hexate \$2.25 Postpaid. Only \$2.00 when ordered with BHC.

We also add Linck WA a superior wetting agent when using low pressure for spraying.

6 oz. bottle 50c, 16 oz. bottle \$1.00, when ordered with above.

DAHLIADEL RECOMMENDATIONS

For Exhibition or Your Garden

If you were at Dahlia del and asked me to check a list of the most satisfactory varieties of dahlias for you to grow, you would probably say you wanted varieties that are not temperamental. Then you would ask for those easy to grow, that produce plenty of flowers good for cutting; house decoration, and exhibition—oh yes, you would want some of the big ones too that will be the envy of the neighborhood. Well, here they are.

With this table of recommended varieties you can pick the types and colors you like most. Where there is more than one, the top variety is the newer and likewise the higher priced one. Practically all of the varieties have won prizes at Shows or Trial Grounds, and will do it again if properly grown and exhibited.

CHRYSANTHEMUM CULTURE

Culture is rather easy. Plant in well prepared ordinary garden soil 8 to 10 inches apart, in rows 15 inches apart for mass planting. Rows can be 3 to 4 feet apart for cultivating. Either work in manure in the fall or winter or use a good garden fertilizer worked into the soil two weeks before planting. Side-dress early in July and again in August. Do not let mums suffer for water. Pinch out soft center when plants are about 6" tall and again when lateral

branches have made a good growth, but not after August 1. For aphids, thrips or other insects use BHC and Hexate spray recommended on page 17.

Protect your late blooming varieties with a suitable covering of muslin, paper or burlap the first frosty nights. This will prevent the frost from settling in the blooms and give you 2 or more weeks of color in your garden.

GREENHOUSE VARIETIES

We have grown all the early blooming popular greenhouse varieties in our fields and have selected the following varieties that do best in outdoor conditions. However, these greenhouse varieties are not hardy and have to be protected through the winter in our climate either in a greenhouse or partially heated coldframe or other protection.

Blooms will be much larger than sizes indicated, if disbudded to single blooms on each branch. Pompons, of course, should not be disbudded.

FIRST FIGURE—diameter of bloom in inches.

SECOND FIGURE—height of bush in feet.

DATE—normal time for plant to be in full bloom.

HARDY GARDEN CHRYSANTHEMUMS

These modern hardy mums are selected for their ability to produce quantities of blooms in general garden conditions. Increasing interest in garden mums is due to recent development of new varieties that bloom safely ahead of frost, while a number of varieties stand the first frost that usually gets the Dahlias. This prolongs the blooming season in your garden by several weeks.

ENGLISH

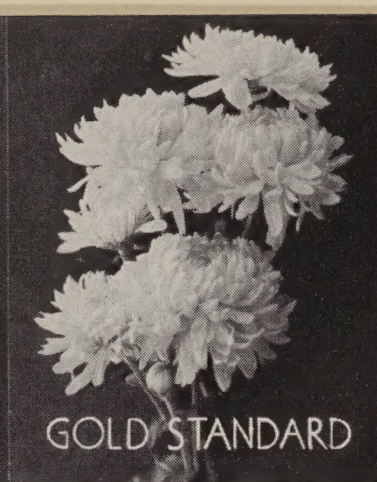

This new race has the advantage of combining size with hardiness.

We have, however, culled our English Varieties down to the 10 that are really hardy, grow well, and produce blooms of equal general quality with the best American varieties. They can be grown much larger than sizes indicated if disbudded the same as Standard Greenhouse Varieties.

ROOTED CUTTINGS are very satisfactory as they stand shipment wonderfully well. They are wrapped singly or two together in live sphagnum moss on a special machine built for this work. In shipment the roots are fed moisture in live sphagnum. The leaves are in a ventilated air space. This insures the best and safest transportation. Rooted cuttings can be planted direct in your garden with some protection or potted up and held for a few weeks.
